

Image-based modeling of the cardiovascular system

C. Alberto Figueroa, PhD

Edward B. Diethrich M.D. Associate Professor of Surgery and Biomedical Engineering
University of Michigan

Honorary Senior Lecturer in Biomedical Engineering
King's College London

CEMRACS 2015 Summer School

CIRM - Luminy

July 20th – 21st 2015

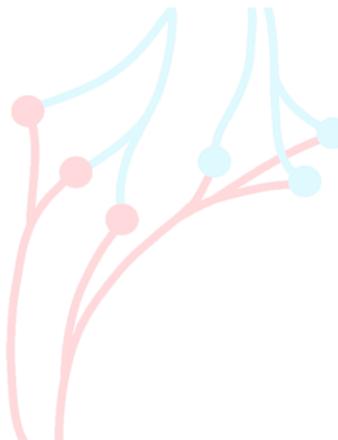

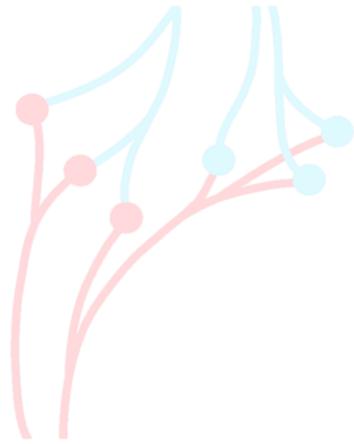

COLLEGE OF ENGINEERING & MEDICAL SCHOOL
COMPUTATIONAL VASCULAR BIOMECHANICS LAB
UNIVERSITY OF MICHIGAN

University of London

Outline

- Lecture 1: Introduction to function and modeling of the CV system
- Lecture 2: Techniques for Parameter Estimation in the CV system
- Lecture 3: Simulation of Transitional Physiology
- Lecture 4: Advanced Topics, Clinical Applications and Challenges

Lecture 4: Advanced Topics, Clinical Applications and Challenges

Importance of Validation in CFD

US FDA's CFD Challenge:

Steady flow through a nozzle at different Reynolds numbers

Stewart et al., CVET 2012

TABLE 1. Flow rates and Reynolds numbers used in simulations.

| Flow rate (m ³ /s) | Throat Reynolds number (<i>Re_t</i>) | Inlet Reynolds number (<i>Re_i</i>) |
|-------------------------------|--|---|
| 5.21×10^6 | 500 | 167 |
| 2.08×10^5 | 2000 | 667 |
| 3.64×10^5 | 3500 | 1167 |
| 5.21×10^5 | 5000 | 1667 |
| 6.77×10^5 | 6500 | 2167 |

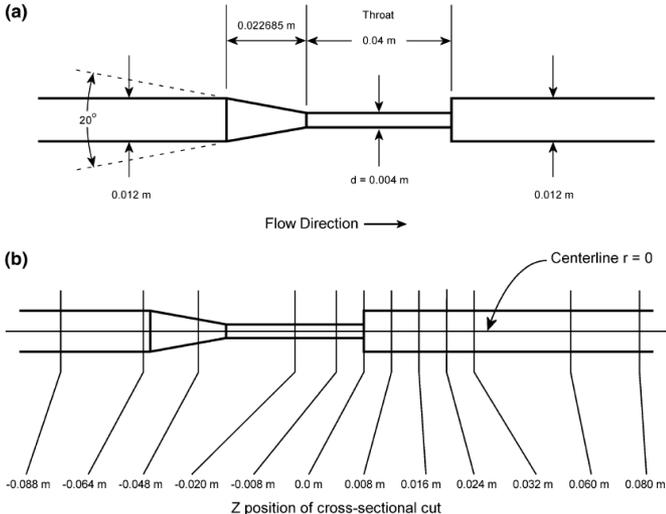

FIGURE 1. Nozzle specifications: (a) dimensions of nozzle (inlet and outlet lengths unspecified); (b) cross-sectional cuts defined for data submission for the sudden expansion.

Steady flow through a nozzle at different Reynolds numbers

28 groups around the world submitted their results

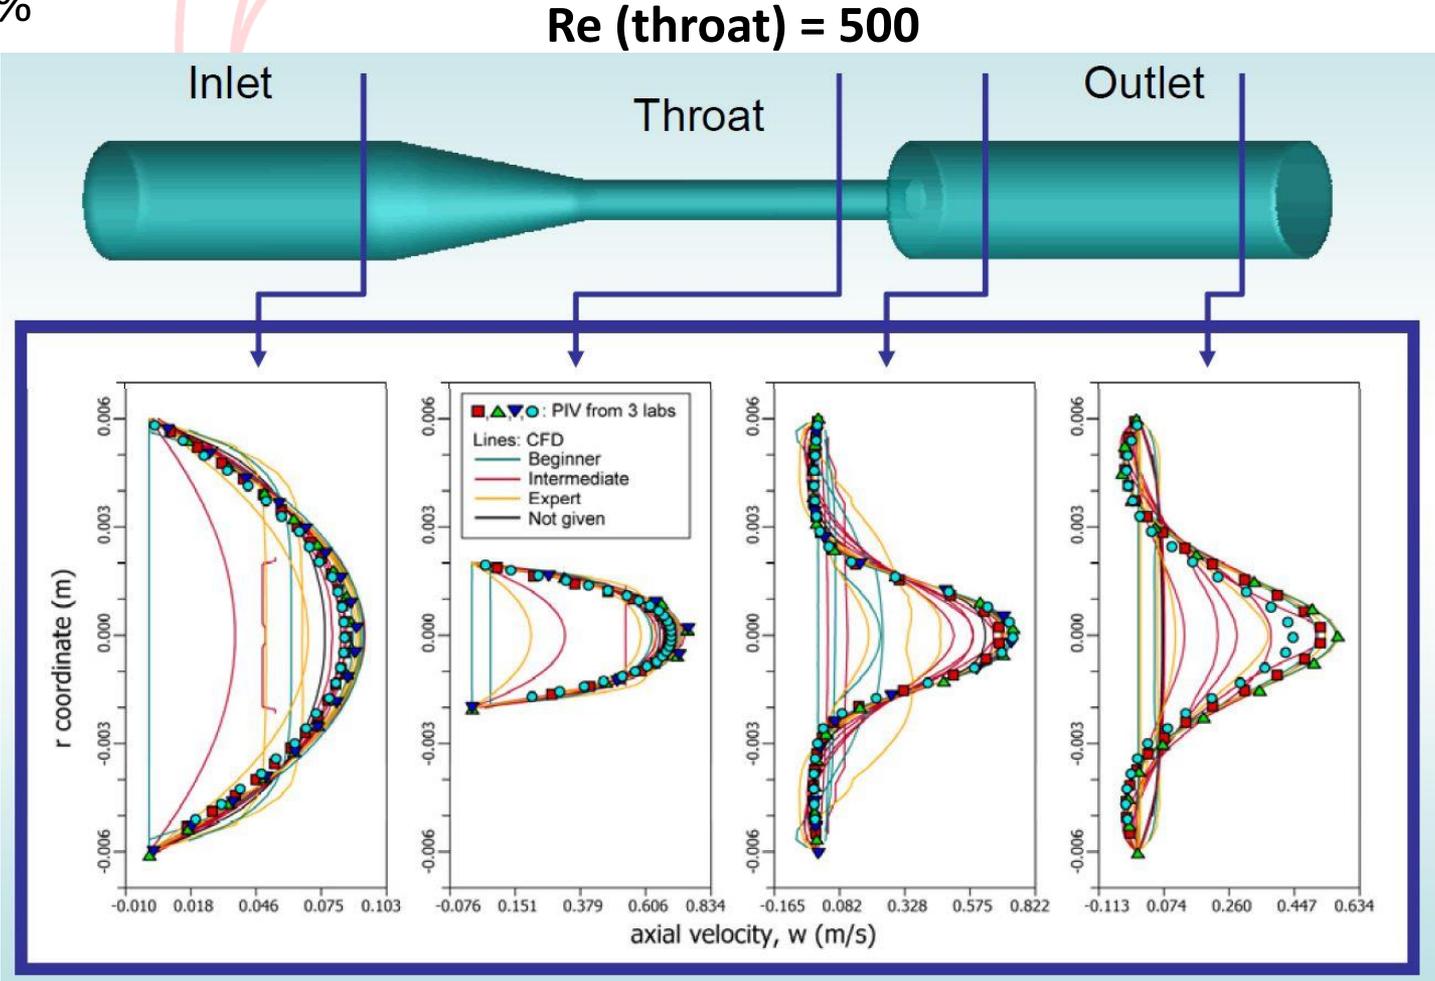

Different modeling assumptions were used: Laminar, and a number of turbulent models

© C. Alberto Figueroa-Figuerola

Importance of Validation in CFD

Very discouraging results were reported:

Up to 5 submissions reported solutions in which the errors on **volumetric flow** were above 10%

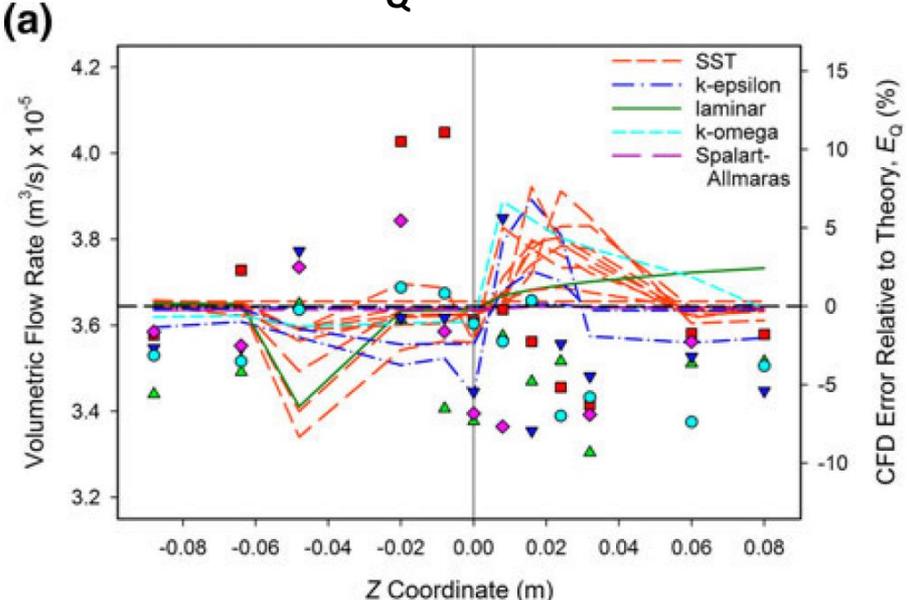

Importance of Validation in CFD

Very discouraging results were reported:

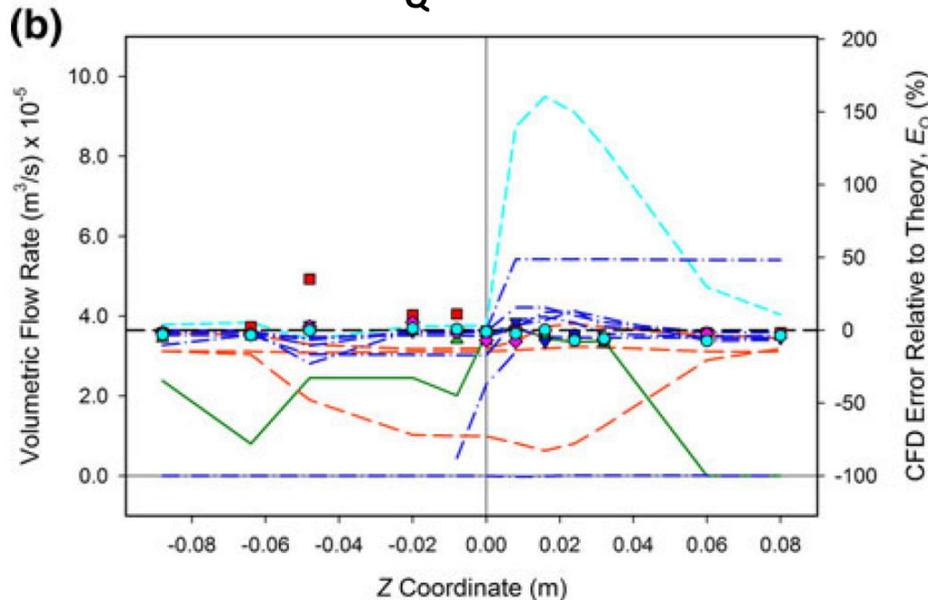

Up to 5 submissions reported solutions in which the errors on **volumetric flow** were above 10%

Re (throat) = 3500

$|E_Q| < 10\%$

$|E_Q| > 10\%$

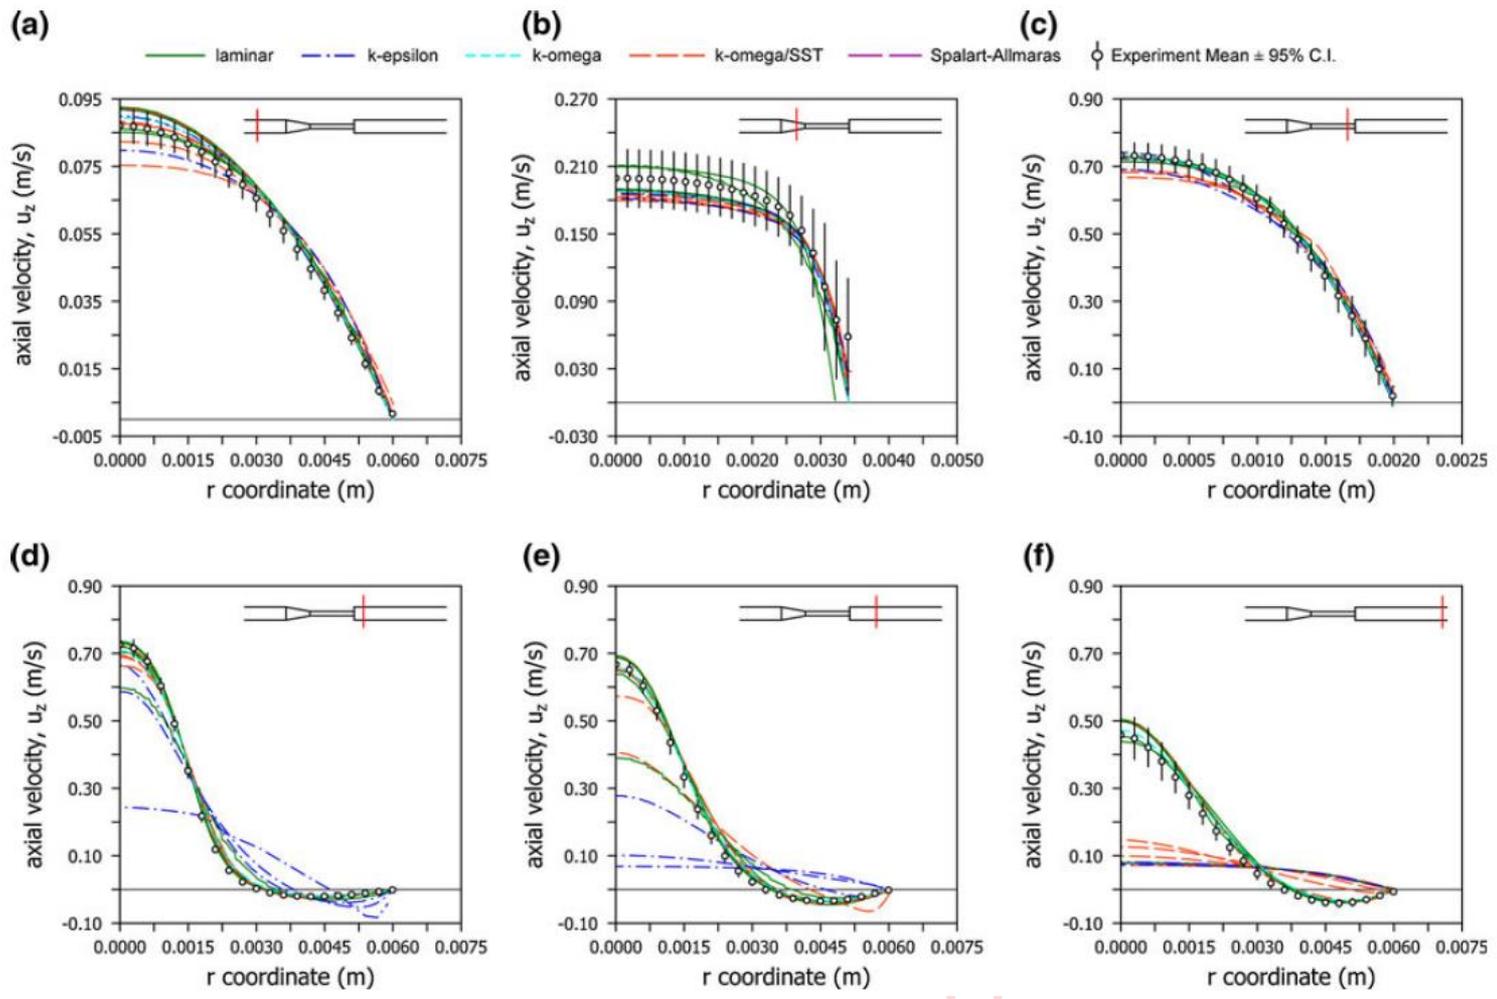

sd.umich.edu

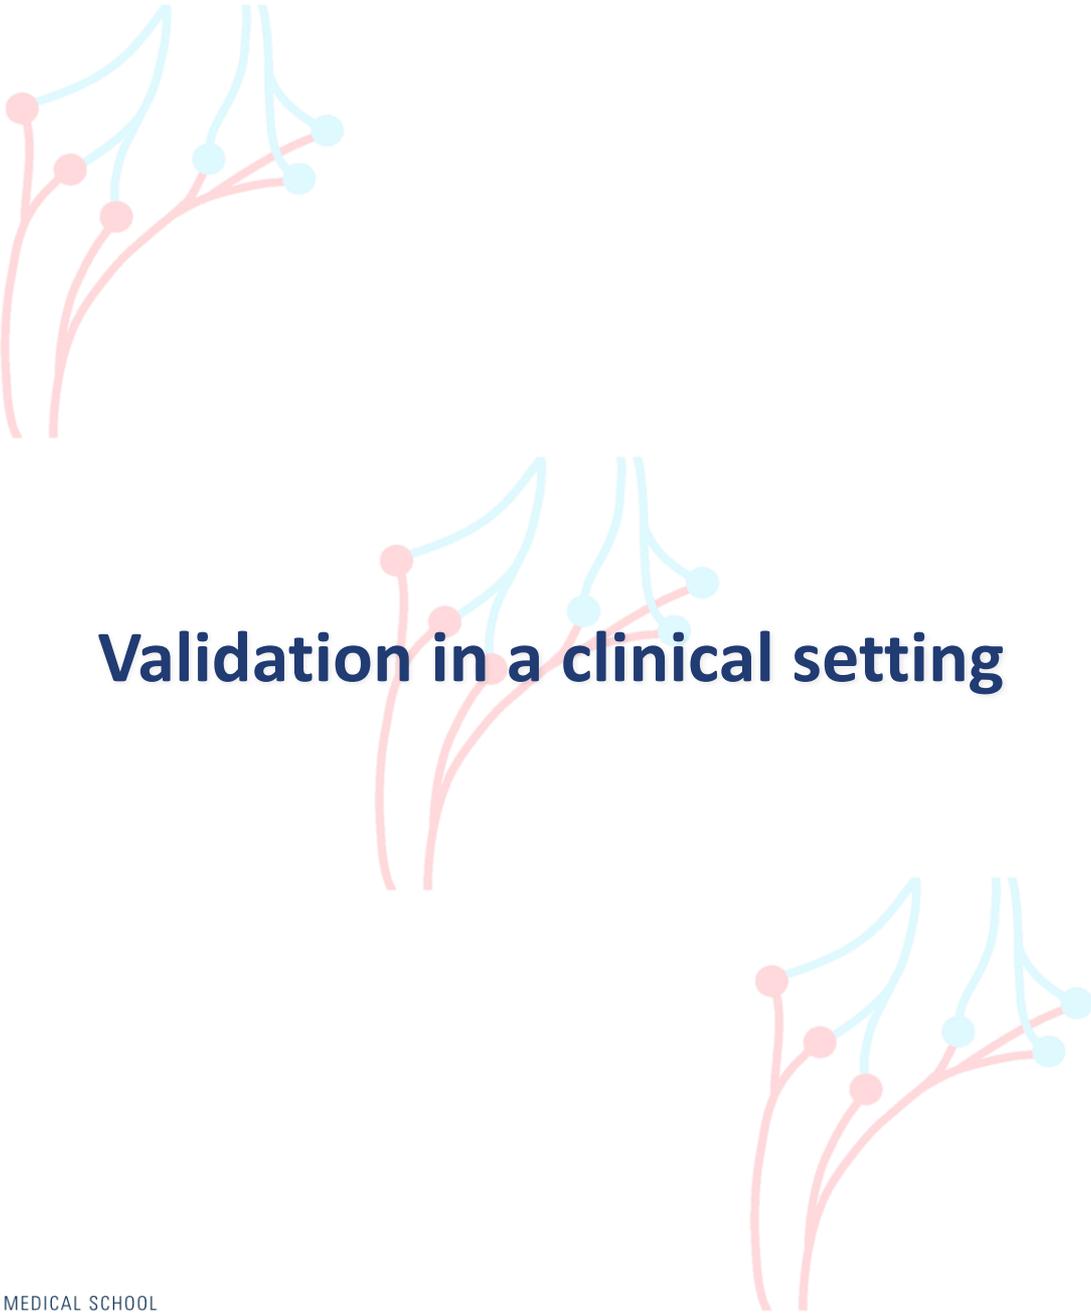

Importance of Validation in CFD

Axial velocity profiles for the $Re = 500$ (easiest case)

Simulations with errors $> 10\%$ are omitted

© C. Alberto Figueroa – figueroc@med.umich.edu

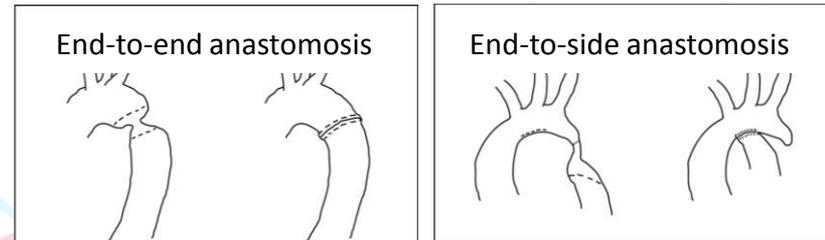

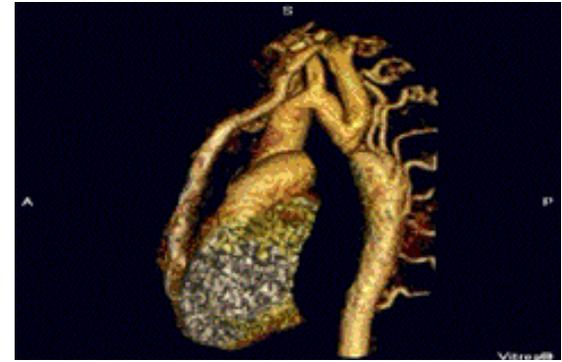

Validation in a clinical setting

Aortic Coarctation

- **Aortic Coarctation (CoA)**

- 8%-11% of congenital heart defects (10 000 patients annually in Western world)
- Treatment: alleviate blood pressure (BP) gradient through the coarctation
- Open repair or stenting

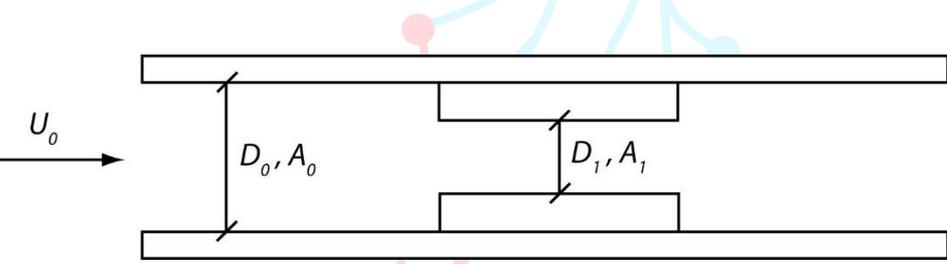

- **Diagnosis and treatment planning: importance of BP metrics:**

- BP at rest:
 - Catheter-driven transducer (accurate but **invasive**)
 - Sphygmometer (less accurate but non-invasive)
 - Doppler ultrasound imaging (Bernoulli's equation)
- BP at stress (pharmacologically-induced):
 - Catheter-driven transducer (accurate but **invasive**)
- Current putative treatment guideline: **BP gradient > 20 mmHg at rest**

tu

Pressure gradient (drop) through a stenosis

U_0 : mean velocity unobstructed tube

D_0, A_0 : Diameter/Area unobstructed tube

D_1, A_1 : Diameter/Area obstructed tube

Seeley & Young, J Biomech, 1976

Reynolds number:

$$Re = \frac{D_0 U_0}{\nu}$$

ν : fluid viscosity

For medium-large Re ,

$$\Delta p \sim constant \cdot \rho U_0^2 \sim constant \cdot Q_0^2$$

Pressure gradient has a complex, nonlinear dependency on flow

MICCAI 2012: Data

8-year old female patient, moderate thoracic aortic coarctation ($\approx 65\%$ area reduction) Body surface area (BSA) was 0.94 m^2 .

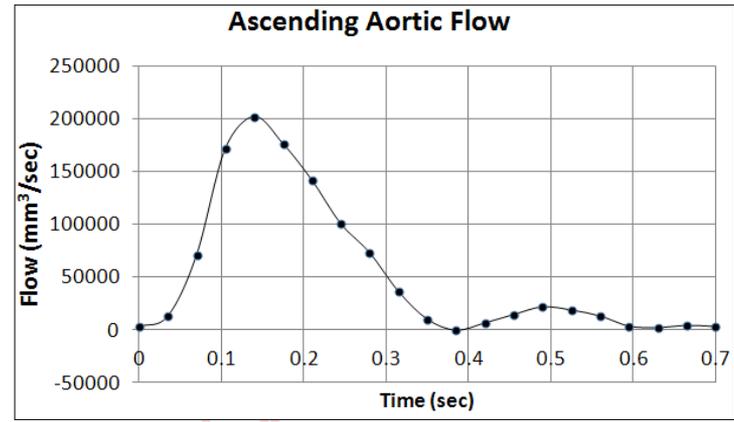

Geometry

Gadolinium-enhanced MRA

Flow

2D PC-MRI

Cardiac output: 3.25 L/min
 Cardiac cycle: 0.7 s

Flow Splits

| Location | Q_{IA} | Q_{LCCA} | Q_{LSA} | Q_{DAo} |
|-------------------------|----------|------------|-----------|-----------|
| % Ascending Aortic Flow | 25.6 | 11.3 | 4.26 | 58.8 |

Pressure

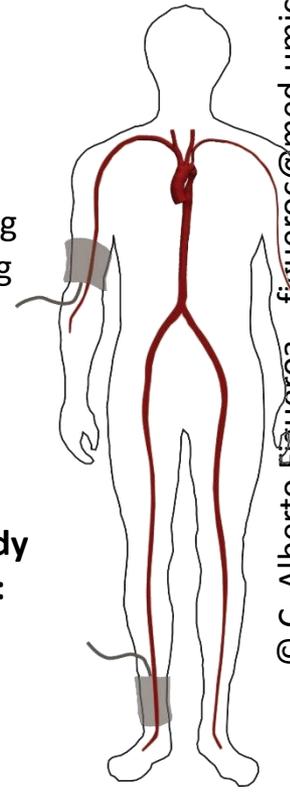

Sphygmometer

Upper Body Pressures:

SBP: 115 mmHg
 DBP: 65 mmHg

Lower Body Pressures:

Hidden

© C. Alberto Figueroa - figueroc@med.umich.edu

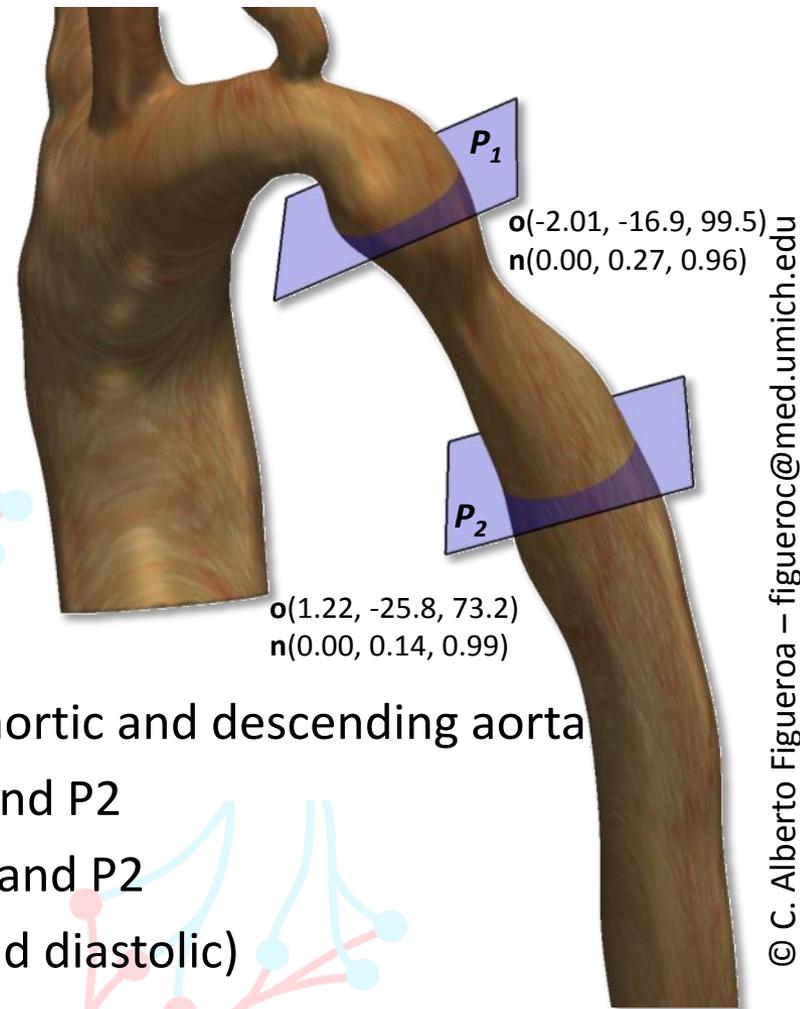

Goal: to report pressure gradient between specific locations

Assumptions

- Rigid walls (fluid computation only)
- Newtonian behavior
- Mass density: 0.001 g/mm^3
- Dynamic viscosity: 0.004 g/mm/s

Deliverables

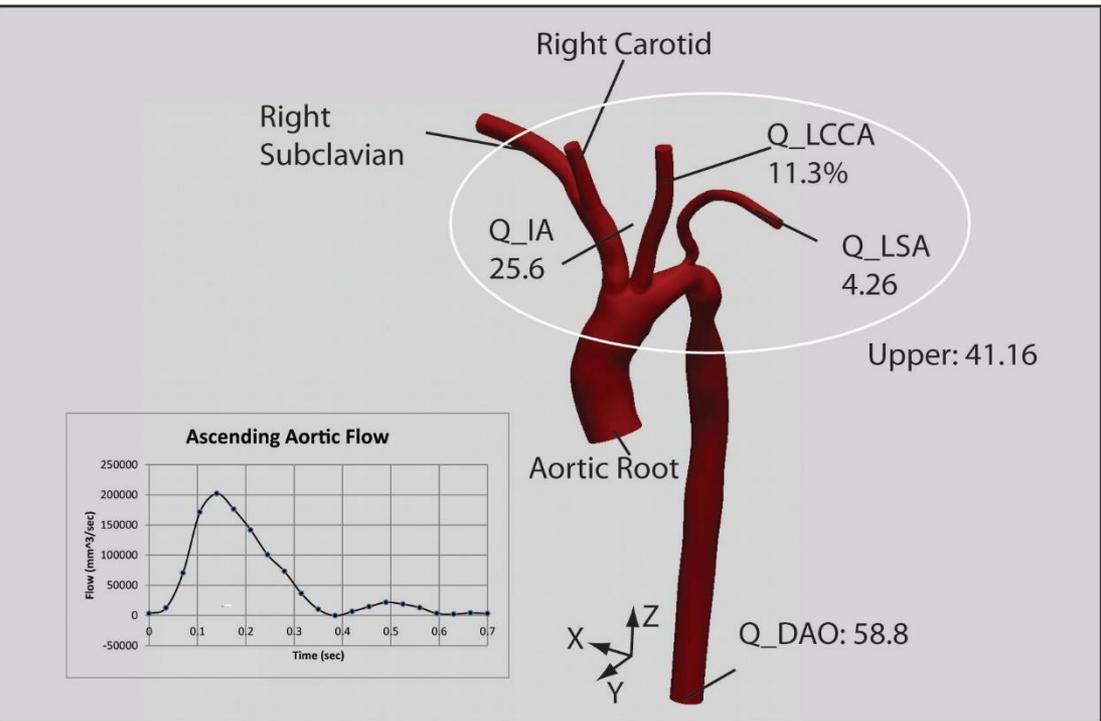

- Flow splits between all outlets (supra-aortic and descending aorta)
- Peak pressure difference between P1 and P2
- Mean pressure difference between P1 and P2
- Pressure in ascending aorta (systolic and diastolic)

Again, the issue is the boundary conditions...

Versatility of coupled outflow BCs to reproduce realistic results with scarce data

Prescribed flow splits approach

VS

Coupled Outflow BC approach

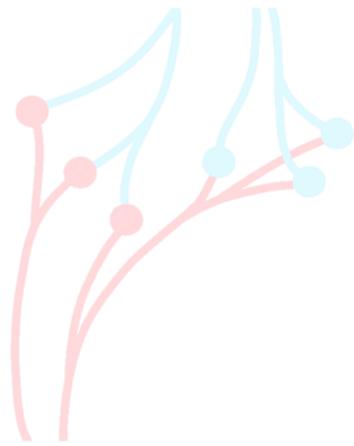

Les et al, Annals Biomed Eng 2010

Take-home messages

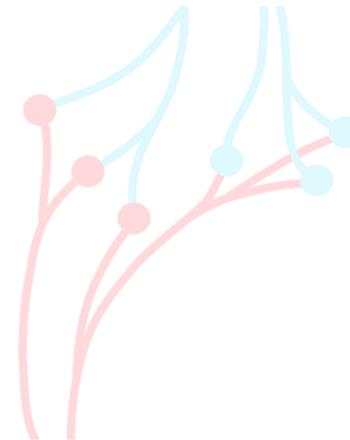

- No winners/losers: we are all 'competing' against ourselves... and the goal is always the same: to replicate physiology.
- Lack of ground truth
- Amplification of the Pressure Pulse in the periphery
- Value of Simulation (when property validated)
- 3 types of results:
 - Globally satisfy all measurements, it requires techniques that have the ability of accommodating uncertainties and lack of completeness in the data
 - Physically-plausible solution, but unable to reproduce clinical measurements
 - Non-physical solution

Take-home messages

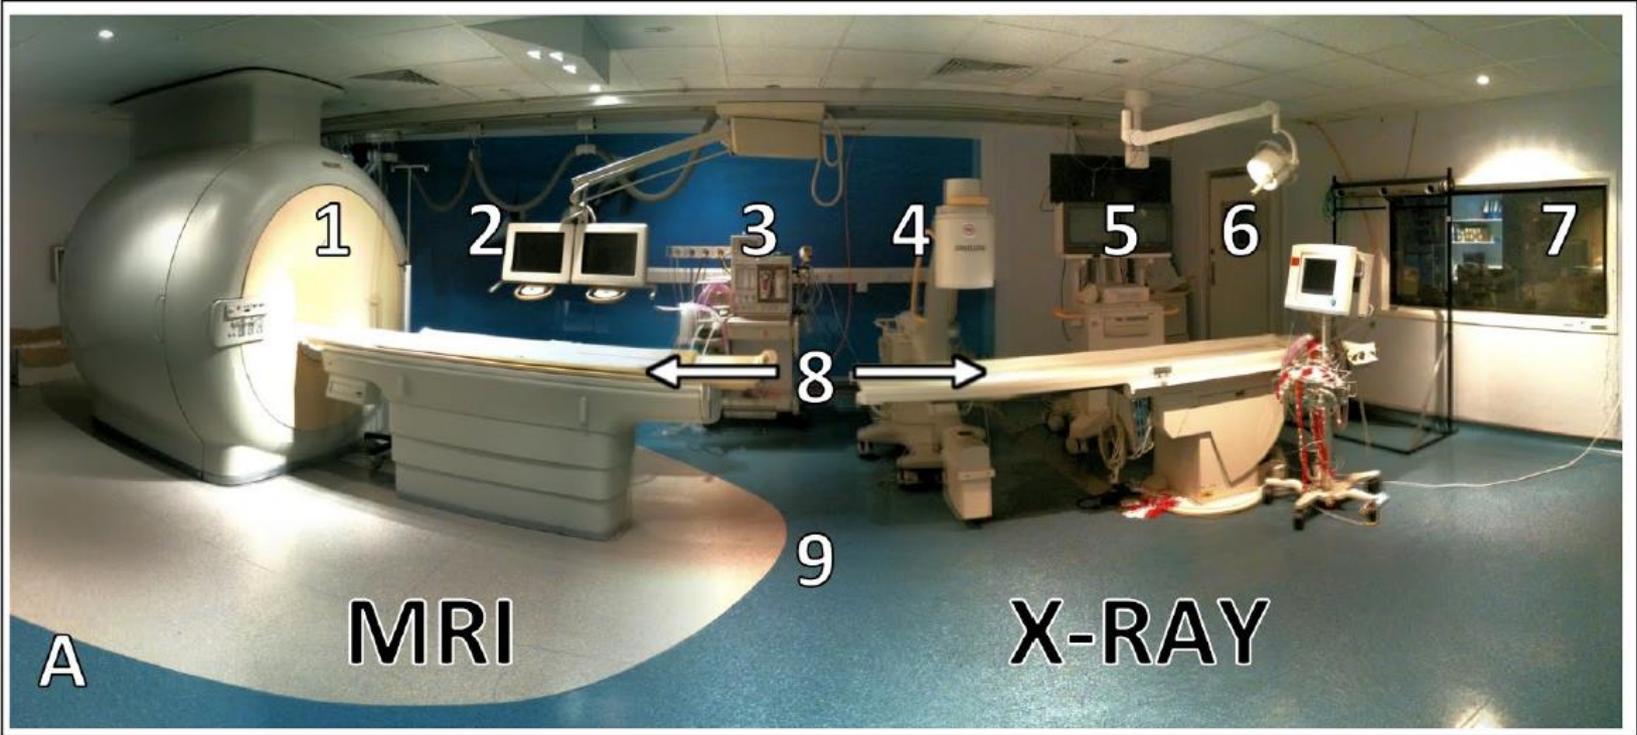

- Velocity-centric submissions
- Pressures are often times ignored (set to zero!)
- Imposing flow splits when waveform is not known forces different pressure gradients in the model (even when the waveforms are known: we need to consider differences between model and measurement)
- 1D Methods not appropriate for coarctation or aneurysms
- Turbulence models or laminar flow assumptions
- Methods with uniform grid size are at a clear disadvantage
- Importance of grid independence assessment

Split of hepatic factors as a function of protrusion length

© C. Alberto Figueroa – figueroa@med.umich.edu

Procedure done on July 10th 2015

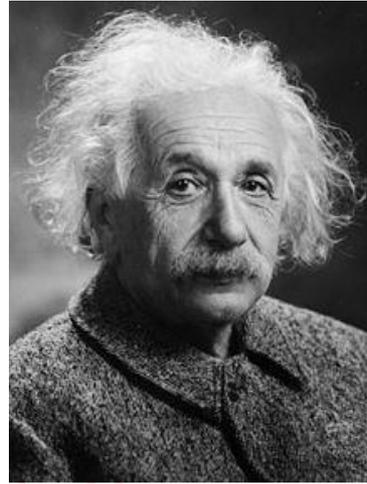

Patient is doing well and is being monitored for changes in AVMs and pulmonary flow

Conclusions

- Mathematical modeling of blood flow can have an impact on:
 - Disease research
 - Medical device design
 - **Surgical planning**
- A trial-and-error paradigm can be replaced by a virtual design and optimization paradigm

Conclusions

- “Everything should be made as simple as possible, but no simpler”

- Parameter estimation is a key effort in the CV modeling field: your model will only be as good as your parameters!
